

8.2.8 Block transform coding: **JPEG**

(page 601)

CODING

(1) Subdivide the image into 8×8 subimages and process them in a from-left-to-right and from-top-to-bottom fashion Why?

(2) Level shifting

Subtract 2^{n-1} from each subimage, where 2^n is the number of gray scales used Why?

(3) Calculate the two-dimensional DCT of each subimage

Why?

(4) Quantize each DCT...

(4.1) Divide with a multiple of a normalization matrix

This multiple is directly proportional to the degree of compression
(figure 8.30 (b), page 600)

(4.2) Round off the result

$$T(u, v) = \text{DCT}\{ f(x, y) \}, \quad \hat{T}(u, v) = \text{round} \left\{ \frac{T(u, v)}{Z(u, v)} \right\}$$

(5) Construct a one-dimensional array from these quantized coefficients, using a zig-zag pattern (figure 8.29 (d), page 598)

(6) Code this array, using run-length and variable-length coding

(6.1) DC coefficient: Code the difference between the DC coefficient of the current subimage and the DC coefficient of the previous subimage
(tables A.3 and A.4, page 934 & 935)

(6.2) AC coefficients: Take the value of each non-zero AC coefficient and the number of zero-valued coefficients that precedes the non-zero AC coefficient into account (tab A.3, p 934, tab A.5, p 935 & 936)
• EOB and 16 successive zeros have special codes
(subimage \equiv “block”)

DECODING

- (1) Decode the array and “zig-zag” back $\rightarrow \hat{T}(u, v)$**
- (2) Multiply with normalization matrix: $\dot{T}(u, v) = \hat{T}(u, v) Z(u, v)$**
- (3) Calculate two-dimensional DICT: $\hat{f}(x, y) = \text{DICT}\{\dot{T}(u, v)\}$**
- (4) Level shift back: Add 2^{n-1} to each subimage**
- (5) Place the subimages in their correct positions**

A typical normalization matrix

16	11	10	16	24	40	51	61
12	12	14	19	26	58	60	55
14	13	16	24	40	57	69	56
