

# A FRAMEWORK FOR MODELLING SPATIO-TEMPORAL COMPETITION AND SPREAD OF INVASIVE PLANT SPECIES IN SOUTH AFRICA

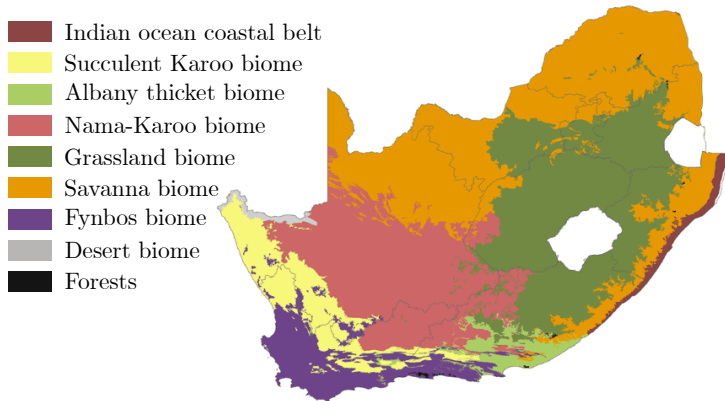

Alexander Flemming\* & Jan van Vuuren

Department of Industrial Engineering  
Stellenbosch University, South Africa

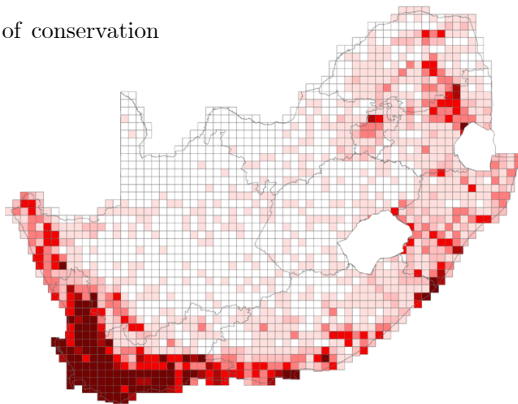

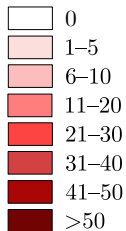

7 December 2022

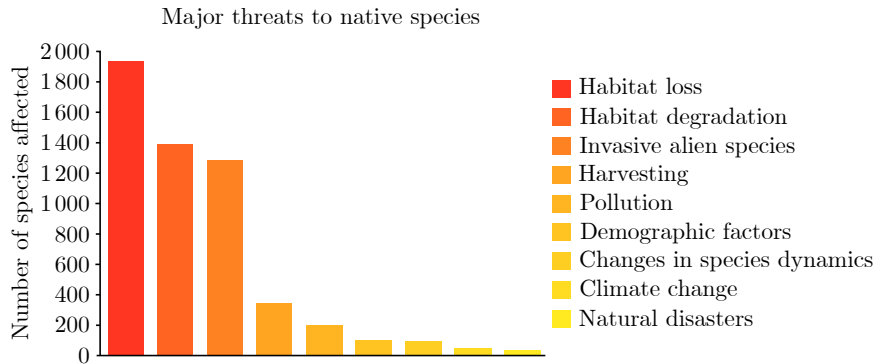

# Introduction

# Introduction

Number of species of conservation concern per QDS

## Introduced species

Plant or animal species found outside of their native distribution range, which have been introduced to a new environment by either accidental or deliberate human activity

# Introduction

## Introduced species

Plant or animal species found outside of their native distribution range, which have been introduced to a new environment by either accidental or deliberate human activity

## Naturalised species

Species that become established and spread beyond the place of introduction

# Introduction

## Introduced species

Plant or animal species found outside of their native distribution range, which have been introduced to a new environment by either accidental or deliberate human activity

## Naturalised species

Species that become established and spread beyond the place of introduction

## Invasive species

A sub-category of naturalised species that exhibit the potential to cause harm to the ecologies into which they are introduced

*National Environmental Management: Biodiversity Act (NEM:BA)*

## Invasive species regulations

- 1 Reducing the risk of introducing species or having those already introduced become invasive
- 2 Limiting the invasion extent and impact.

# Introduction

*National Environmental Management: Biodiversity Act (NEM:BA)*

## Invasive species regulations

- 1 Reducing the risk of introducing species or having those already introduced become invasive
- 2 Limiting the invasion extent and impact.

## Categories

- 1a Species targeted for national eradication
- 1b Controlled as part of a national management programme, trading and spread prohibited
- 2 An extension of category 1b, but permits may be issued for the species' usage
- 3 Species that may be kept without permits, that may not be traded or further propagated.

## Problem statement

Design and develop a generic framework capable of creating high-quality models to predict the spatio-temporal competition between, and spread of, invasive species

## Problem statement

Design and develop a generic framework capable of creating high-quality models to predict the spatio-temporal competition between, and spread of, invasive species

## Important objectives

- Rank environmental parameters that correlate with the current distribution of an invasive species

## Problem statement

Design and develop a generic framework capable of creating high-quality models to predict the spatio-temporal competition between, and spread of, invasive species

## Important objectives

- Rank environmental parameters that correlate with the current distribution of an invasive species
- Identify regions of study prone to invasive outbreaks

## Problem statement

Design and develop a generic framework capable of creating high-quality models to predict the spatio-temporal competition between, and spread of, invasive species

## Important objectives

- Rank environmental parameters that correlate with the current distribution of an invasive species
- Identify regions of study prone to invasive outbreaks
- Simulate potential future spread and ecological influence

## Problem statement

Design and develop a generic framework capable of creating high-quality models to predict the spatio-temporal competition between, and spread of, invasive species

## Important objectives

- Rank environmental parameters that correlate with the current distribution of an invasive species
- Identify regions of study prone to invasive outbreaks
- Simulate potential future spread and ecological influence
- Recommend suitable management and control methods to inhibit their spread.

Australian Acacia species are some of the most widespread invasive plants globally and have been documented very well in South Africa.

Australian Acacia species are some of the most widespread invasive plants globally and have been documented very well in South Africa.

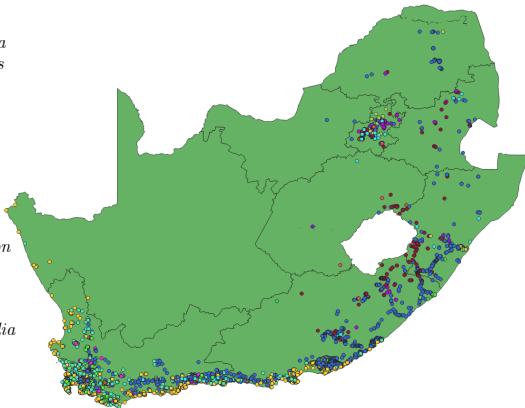

## South African context

- 71 species have been introduced to South Africa
- 23 are considered invasive
- Similar reproductive and physiological traits
- High-quality population distribution data.

# Australian Acacias

Australian Acacia species are some of the most widespread invasive plants globally and have been documented very well in South Africa.

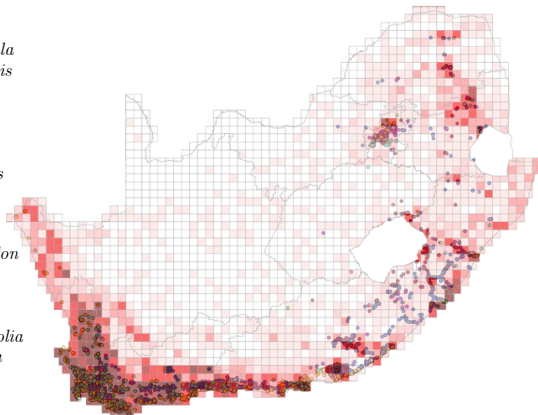

- *Acacia acunda*
- *Acacia baileyana*
- *Acacia binervata*
- *Acacia crassiuscula*
- *Acacia cultriformis*
- *Acacia cyclops*
- *Acacia dealbata*
- *Acacia decurrens*
- *Acacia elata*
- *Acacia falciformis*
- *Acacia implexa*
- *Acacia longifolia*
- *Acacia mearnsii*
- *Acacia melanoxylon*
- *Acacia paradoxa*
- *Acacia pendula*
- *Acacia piligera*
- *Acacia podalyriifolia*
- *Acacia pycnantha*
- *Acacia saligna*
- *Acacia stricta*
- *Acacia ulicifolia*
- *Acacia viscidula*

# Australian Acacias

Australian Acacia species are some of the most widespread invasive plants globally and have been documented very well in South Africa.

- *Acacia acunda*
- *Acacia baileyana*

- *Acacia mearnsii*
- *Acacia melanoxylon*
- *Acacia paradoxa*
- *Acacia pendula*
- *Acacia piligera*
- *Acacia podalyriifolia*
- *Acacia pycnantha*
- *Acacia saligna*
- *Acacia stricta*
- *Acacia ulicifolia*
- *Acacia viscidula*

# SPACSYS Framework overview

## Spatial analysis component

- Select study region and create a spatial grid

# SPACSYS Framework overview

## Spatial analysis component

- Select study region and create a spatial grid
- Append environmental data and species observations.

# SPACSYS Framework overview

## Spatial analysis component

- Select study region and create a spatial grid
- Append environmental data and species observations.

## Machine learning component

- Extract and validate species-environment relationships

# SPACSYS Framework overview

## Spatial analysis component

- Select study region and create a spatial grid
- Append environmental data and species observations.

## Machine learning component

- Extract and validate species-environment relationships
- Predict suitable habitats and potential sites of invasion.

# SPACSYS Framework overview

## Spatial analysis component

- Select study region and create a spatial grid
- Append environmental data and species observations.

## Machine learning component

- Extract and validate species-environment relationships
- Predict suitable habitats and potential sites of invasion.

## Cellular automata component

- Define population dynamics model

# SPACSYS Framework overview

## Spatial analysis component

- Select study region and create a spatial grid
- Append environmental data and species observations.

## Machine learning component

- Extract and validate species-environment relationships
- Predict suitable habitats and potential sites of invasion.

## Cellular automata component

- Define population dynamics model
- Simulate spatio-temporal population dynamics.

# SPACSYS Framework overview

## Spatial analysis component

- Select study region and create a spatial grid
- Append environmental data and species observations.

## Machine learning component

- Extract and validate species-environment relationships
- Predict suitable habitats and potential sites of invasion.

## Cellular automata component

- Define population dynamics model
- Simulate spatio-temporal population dynamics.

## Adaptive management component

- Categorise invaded regions for management and control

# SPACSYS Framework overview

## Spatial analysis component

- Select study region and create a spatial grid
- Append environmental data and species observations.

## Machine learning component

- Extract and validate species-environment relationships
- Predict suitable habitats and potential sites of invasion.

## Cellular automata component

- Define population dynamics model
- Simulate spatio-temporal population dynamics.

## Adaptive management component

- Categorise invaded regions for management and control
- Apply and evaluate management strategies.

# Spatial analysis component: Region selection

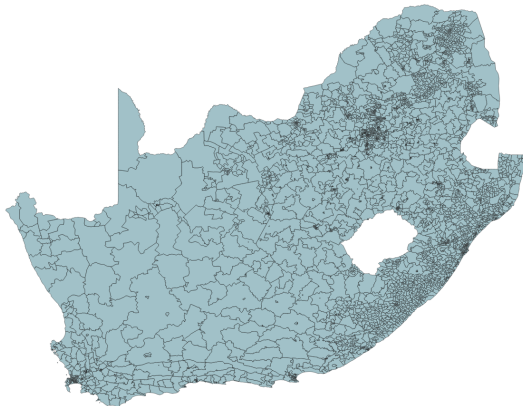

## Spatial analysis component

- Select study region and create a spatial grid
- Append environmental data and species observations.

# Spatial analysis component: Region selection

## Spatial analysis component

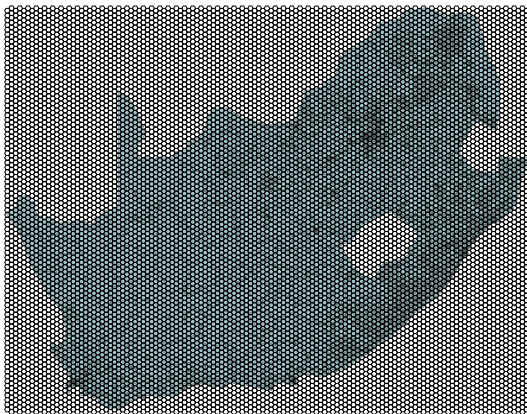

- Select study region and create a spatial grid
- Append environmental data and species observations.

# Spatial analysis component: Region selection

## Spatial analysis component

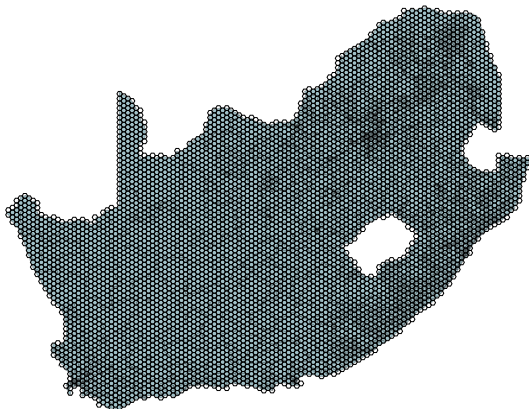

- Select study region and create a spatial grid
- Append environmental data and species observations.

# Environmental parameters

Environmental parameters (EPs) that define the environmental characteristics of study region.

Environmental parameters (EPs) that define the environmental characteristics of study region.

## EP data types examples

- Continuous (numerical) data
  - Temperature
  - Precipitation
  - Slope and elevation
  - Distance from water sources

Environmental parameters (EPs) that define the environmental characteristics of study region.

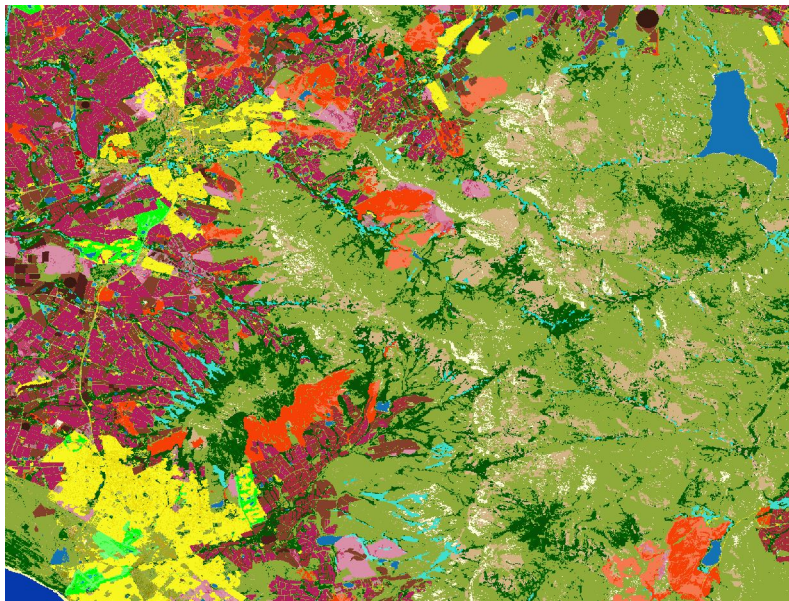

## EP data types examples

- Continuous (numerical) data
  - Temperature
  - Precipitation
  - Slope and elevation
  - Distance from water sources
- Categorical data
  - Land cover
  - Soil types
  - Water drainage

# Environmental parameters

# Environmental parameters

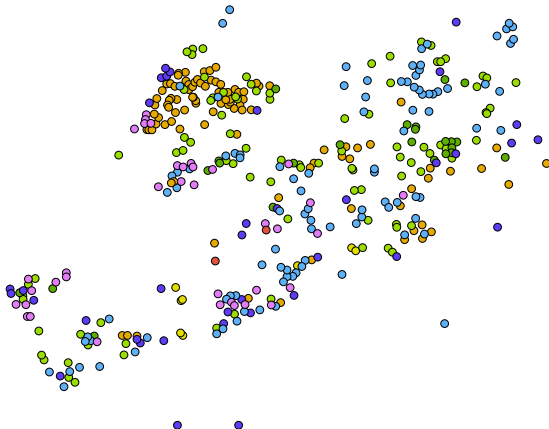

# Observation data

*Species distribution data*, typically presented as GPS coordinate data, indicate where the species occur.

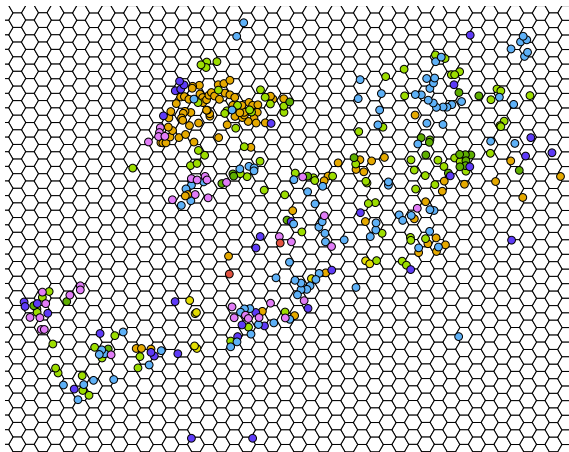

# Observation data

*Species distribution data*, typically presented as GPS coordinate data, indicate where the species occur.

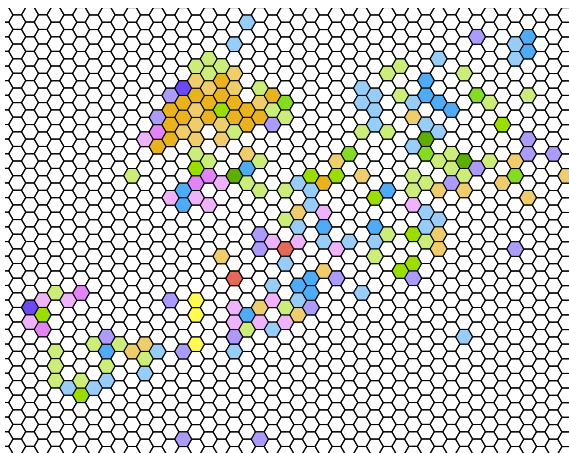

# Observation data

*Species distribution data*, typically presented as GPS coordinate data, indicate where the species occur.

# Observation data

*Species distribution data*, typically presented as GPS coordinate data, indicate where the species occur.

**Table:** A representation of the populated spatial grid data set.

ID	...	Lat	Long	...	EPs			...	Unique species			
					EP <sub>1</sub>	EP <sub>2</sub>	EP <sub>3</sub>		S <sub>1</sub>	S <sub>2</sub>	S <sub>3</sub>	...

*Acacia podalyriifolia*

*Acacia pycnantha*

*Acacia saligna*

# Cellular automata component

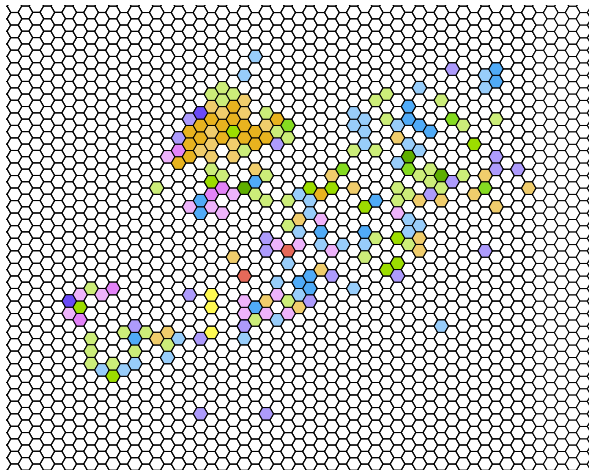

## Cellular automata component

- Define population dynamics model
- Simulate spatio-temporal population dynamics.

# Cellular automata component

## Cellular automata component

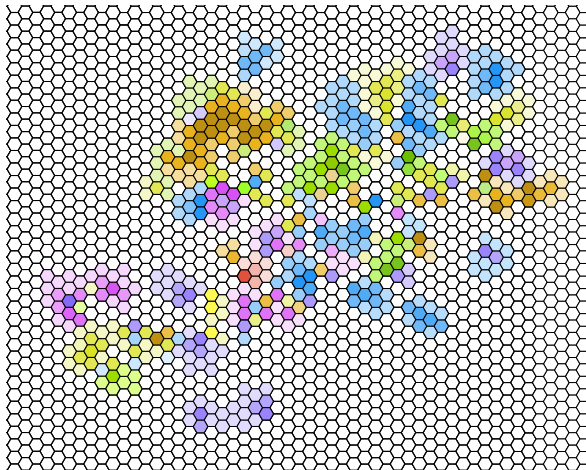

- Define population dynamics model
- Simulate spatio-temporal population dynamics.

# Cellular automata component

## Cellular automata component

- Define population dynamics model
- Simulate spatio-temporal population dynamics.

Population dynamics governed by a Lotka-Volterra competition reaction-diffusion system.

Population dynamics governed by a Lotka-Volterra competition reaction-diffusion system.

**Vacant.** A species population does not exist within the cell.

**Populated.** A species population exists within the cell.

**Saturated.** The species population has reached its carrying capacity.

**Restricted.** A cell cannot facilitate the population of a species.

# CA component: Cell states

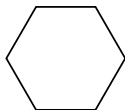

Population dynamics governed by a Lotka-Volterra competition reaction-diffusion system.

**Vacant.** A species population does not exist within the cell.

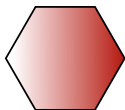

**Populated.** A species population exists within the cell.

**Saturated.** The species population has reached its carrying capacity.

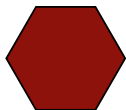

**Restricted.** A cell cannot facilitate the population of a species.

Vacant

Populated

Saturated

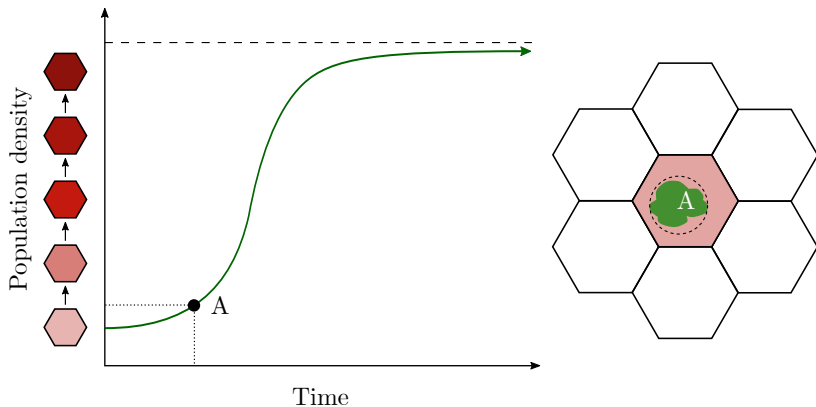

Restricted

# CA component: Transition rules

**Population growth.** If a species population is present in a cell, that population size will increase subject to other species' presence.

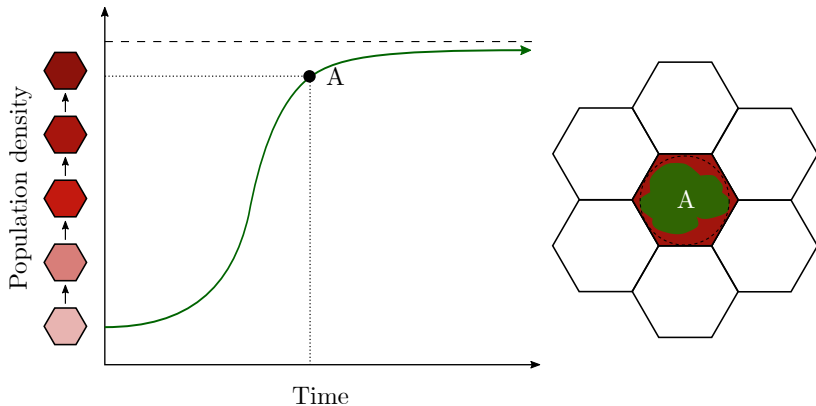

# CA component: Transition rules

**Population growth.** If a species population is present in a cell, that population size will increase subject to other species' presence.

# CA component: Transition rules

**Population growth.** If a species population is present in a cell, that population size will increase subject to other species' presence.

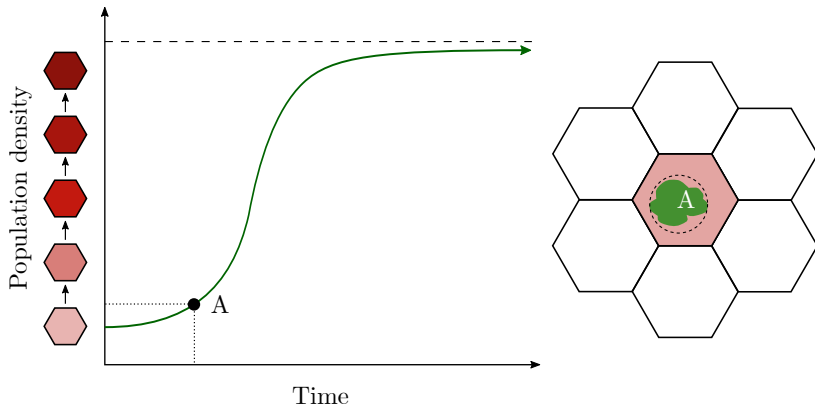

# CA component: Transition rules

**Population dispersal.** If a species is old enough to produce offspring, the offspring will disperse among neighbouring cells.

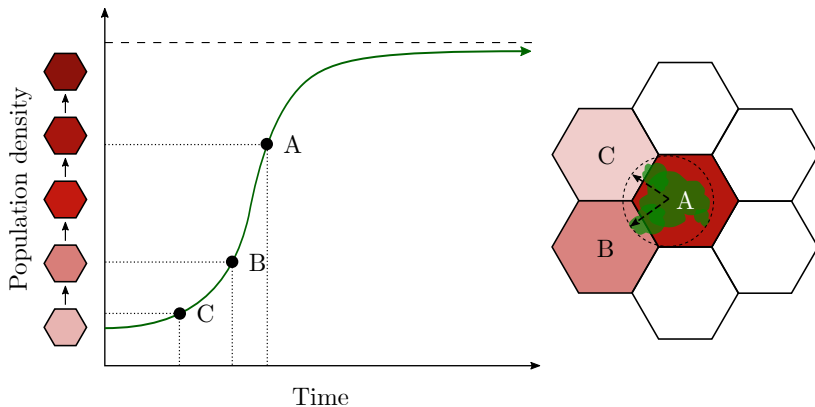

# CA component: Transition rules

**Population dispersal.** If a species is old enough to produce offspring, the offspring will disperse among neighbouring cells.

# CA component: Transition rules

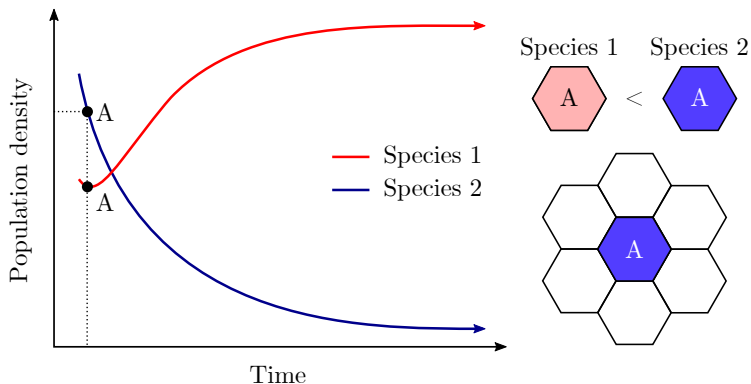

**Population dispersal.** If a species is old enough to produce offspring, the offspring will disperse among neighbouring cells.

**Population extinction.** If the population density of a species in a cell decreases to zero due to competition with other species or insufficient population growth.

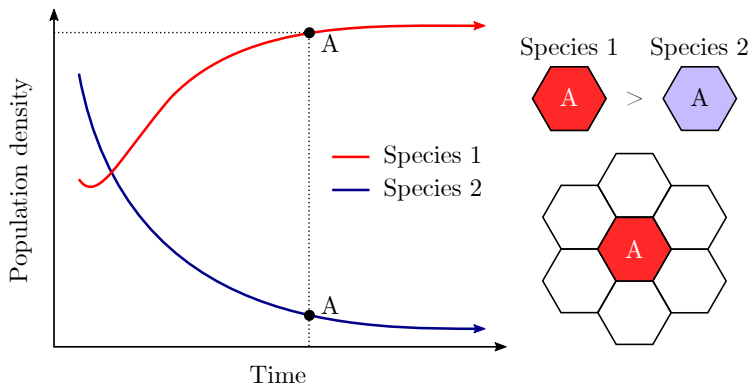

# CA component: Transition rules

**Population extinction.** If the population density of a species in a cell decreases to zero due to competition with other species or insufficient population growth.

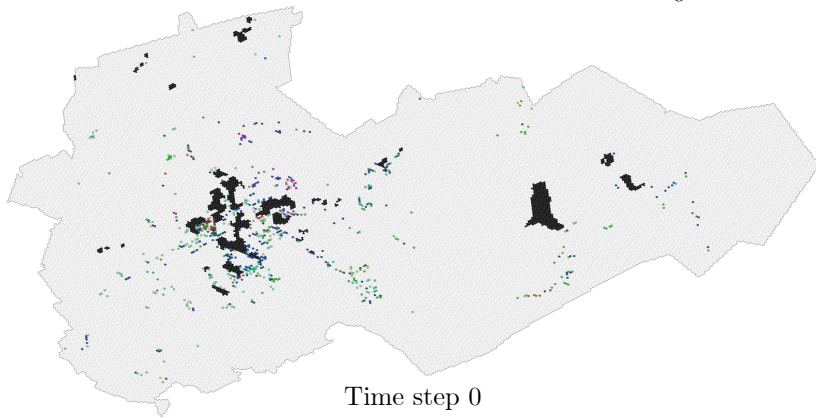

# CA component: Transition rules

**Population extinction.** If the population density of a species in a cell decreases to zero due to competition with other species or insufficient population growth.

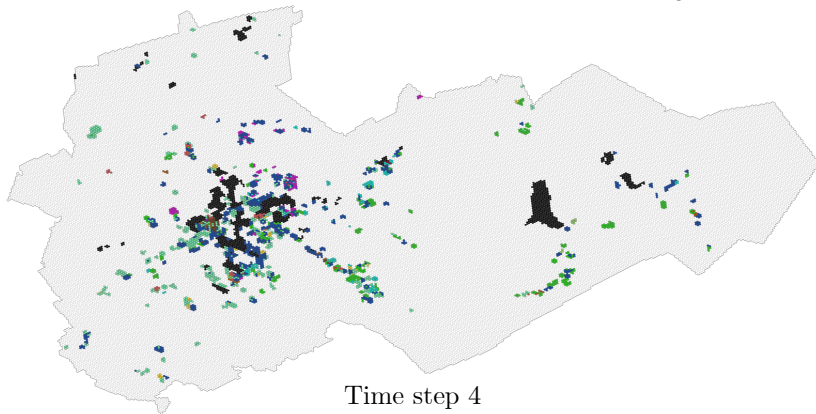

# Predicting competition and spread
